

Microbiological Verifications

Sysco Environmental Ltd is a leader in providing a range of microbiological surveys for industrial customers, insurance providers and domestic customers for the purposes of process contamination control and clean up verifications. Microbiological surveys are usually carried out following an incident or for the purposes of post-peril sanitation verification. Microbiological testing is carried out for pre-selected target organisms which are likely to be present or cause harm in a given situation.

Our team of surveyors have carried out investigation of a variety of premises such as:

- Domestic properties
- Commercial production
- Product line contamination testing
- Operating theatres verifications
- Bio-aerosol exposure testing
- Post clean-up verifications

We use established and verified sample collection methods and whenever possible accredited laboratories to perform target specific analysis. We pride ourselves in implementing diligent and comprehensive sampling protocols which ensure reliable data and customer satisfaction.

We will provide our customers with confidence that implemented control measures are effective, provide assurance to product quality control and safety, and give early warning should contamination occur.

We have participated in a number of grey and black water contamination incidents and perform site sampling for pathogenic bacterial such E. Coli, Faecal Enterococci, Streptococci and many others to assess the conditions in the affected properties. We are helping third party contractors to prepare detailed clean-up procedures to address grey and black water contamination. Following the clean-up we can perform site verification testing to ensure that the remediation has been carried out to a satisfactory level and that the properties are fit for habitation.

Following the successful completion of sanitation and the microbiological survey we will issue a certificate of reoccupation for the premises under investigation.
