

Health Care Monitoring Services

We provide our health care customers with a responsive high quality service for the measurements of chemical and biological contaminants in the hospital environments. Our comprehensive range of health care related services include clean room verification and certification, biological contamination tracking, and chemical exposure evaluations and specialist deep cleans.

Our qualified technicians can evaluate efficiency of the existing air filtration systems by evaluation the levels of airborne microorganism in the minor surgery rooms, standard and ultraclean operating theaters. The microbiological testing procedures are based on HTM 2025/03-01 and the guidance produced by the Hospital Infection Society.

We can evaluate the risk to your employees from exposure to a variety of hazardous chemicals used in the hospital environment. The professionals working in the operating theaters, anaesthetic rooms, endoscopy, body scan areas and pathology units are often exposed to hazardous agents.

We routinely perform monitoring for employees exposure to anaesthetic gases such as nitrous oxide, sevoflurane, desflurane and isoflurane. Sterilisation and routine cleaning can lead to high exposure to substances such as formaldehyde, glutaraldehyde, chlorine dioxide, paracetic and acetic acid and hydrogen peroxide.

Your organisation can benefit from our health care tailored monitoring services which will provide you with accurate and reliable data on the performance and suitability of your control systems, employees' exposure patterns, contaminants sources, equipment fault identification and much more.
